HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Projects in manuscript studies

MBH – Manuscripta Bibliae Hebraicae. Hebrew Bible Manuscripts in Western Europe in the 12th and 13th Centuries: A Material, Cultural and Social Approach

Élodie Attia, Aix-Marseille University / CNRS

The last decades have witnessed two main developments affecting the study of Hebrew Bible manuscripts. Firstly, the widespread availability of digitised Hebrew manuscripts on the internet: for example, the collections of the Vatican Library, the Oxford Digital Library at the University of Oxford, the British Library, the Cambridge University Library and the Bibliothèque Nationale de France are easily accessible online. Secondly, various databases have been created, which are dedicated to medieval Hebrew manuscripts in general, not specifically to biblical items. This development started in the mid-1960s with *SfarData*; in the past decade, the *Friedberg Genizah Project* and *Books within Books* databases, amongst others, have been launched. These advancements have made it possible and desirable to reassess the systematic study of the medieval Hebrew Bible manuscripts that are widely available on the web, from an equally renewed collaborative and transversal perspective.

The great biblical scholar and Masorete Gérard E. Weil commenced working on a systematic study of Hebrew Bible manuscripts, preparing in the early 1970s a *Catalogue général de la Bible hébraïque et du Targum, dans les collections publiques et privées*.¹ Unfortunately, his untimely death in 1986 prevented its continuation. A critical re-evaluation remains crucial nonetheless, both for the insight it affords into the more general phenomena connected to the production of the Hebrew book, and to improve our discernment regarding the types of Bible produced during the Middle Ages and the variety of biblical texts used in the medieval Jewish world. A general, more quantitative insight could facilitate in-depth research into specific qualitative aspects and thus determine medieval socio-cultural standards, cultural transfers and socio-cultural practices concerning the transmission of the Biblical text.

A starting point for such vast investigation is the project *Manuscripta Bibliae Hebraicae. Hebrew Bible Manuscripts in Western Europe in the 12th and 13th Centuries: A Material, Cultural and Social Approach* (MBH)

1 Attia forthcoming.

directed by Élodie Attia at Aix-Marseille University CNRS (CPAF TDMAM UMR 7297). The aim of this four-year project, financed by the French Organization for Scientific Research (Agence nationale de la recherche, ANR), is to provide a systematic survey of medieval Hebrew Bible manuscripts and introduce a preliminary typology of Hebrew Bibles produced before 1300 CE in Ashkenaz (England, Northern France, Germany, and Northern Italy under German authority). In order to facilitate the development of this preliminary typology, an analytical descriptive database with a multi-criteria search engine is being currently developed. Initially, the database will be limited to a corpus of circa 115 Ashkenazic manuscripts, either dated or mostly undated, which include biblical text (complete or partial). Later on, the database will enable the processing of a larger number of sources, whether late-medieval texts or manuscripts from geocultural areas other than the Ashkenazic region, in order to further the comparative approach needed for an exhaustive look at the 'Bible' phenomenon. Finally, it should be stressed that a keen interest in 'late' Bibles can be reported for Latin Studies² but also Hebrew Studies, as is testified by the growing number of projects explicitly reflecting on this subject, among them, the SFB 933 Subproject B4 (Heidelberg), aiming at providing an on-line edition of MS Vatican, BAV, Vat. Ebr. 14;³ the LEGARAD project on late Sephardic Bibles initiated by Javier del Barco (Madrid); the ERC ParaTextBib project on paratexts in Greek Bibles (Munich); the Biblia Arabica project headed by Ronny Vollandt (Munich); and the Textual History of the Bible editorial project concerning the Bible in all languages supervised by Armin Lange (Vienna).

Therefore, the MBH project is not only intended to create a directory of manuscripts as already is the case for Latin (R. Gryson) and Greek (A. Rahlfs) biblical texts, though it could contribute to it. The MBH project and its connected database aspire to facilitate cross-questioning by means of codicological and palaeographical criteria (measurements and size, writing support and material features, layout and mise en texte, decoration, structure of the books, estimated date and provenance), scribal practices and textual traditions (feature of the consonantal or Masoretic text, forms of accents, order of books and of the contents, reader annotations, cultural transfers from non-Jewish culture to Jewish book and vice versa), and the possible uses and functions of biblical manuscripts. Obviously, the project aims to take into account different kinds of sources: from dated codices (less than 40 items are described in SfarData from a codicological point of view) to a majority of non-dated codices and li-

DIGITAL HUMANITIES
NEWS

MBH is an ACHN ANR project which supports the systematic study of Hebrew biblical manuscripts produced in Western Europe before 1300, with a view to establishing their typology on the basis of their form and content.

— Thanks to the growing number and digitisation of Hebrew manuscripts on the net, as well as the existence of several databases devoted to Hebrew manuscripts in general (Sfardata, Books within Books), a systematic study specific to medieval Hebrew biblical manuscripts is now possible and indispensable. This research – which, previously, has never been presented as one of the most copied books of the Jewish Middle Ages – is crucial in terms of our understanding of the phenomena related to the production of Western and Hebrew books as well as getting a better sense of the place occupied by the Hebrew Bible on the basis of its material forms and the types of biblical text used during the medieval period, including in the Christian world.

The variety of the biblical manuscripts is linked, for example to their formats (size, pocket, intermediary), their state (complete/partial), the presence of vocalisation, Masorah, commentaries, and ornaments. For the purposes of analysis, a new interoperative tool which puts together all the available data has been developed: the MBH database is an analytical description type of database equipped with a multi-criteria research engine. This tool should make it possible to run queries based on codicological and palaeographic criteria as well as the scribal, textual and historical traditions of Hebrew Bibles.

The project brings together and/or produces data on dated and non-dated manuscripts, codices and liturgical scrolls, whether complete, partial or fragmentary. A limited initial corpus of around one hundred biblical manuscripts produced before 1300 in the Ashkenaz Jewish world of England, northern France, Germany and northern Italy has been selected as a test. Besides giving access to the database devoted to Hebrew Bibles, the MBH portal will also provide various information, tools and experiments that have been carried out, in particular the 3D digitisation of manuscripts which enables a better material understanding of medieval manuscripts and fosters the study of the materialisation of the texts and their significance.

Corpus

There are as yet no precise statistics on the total number of Hebrew Bibles presently conserved. The MBH Project should improve our knowledge of the corpus. At the current state of research, of the 40,000 manuscripts known to be medieval, 3,200 are precisely dated, representing just under 10 % of the total (Slat. 1994, 10-11). There seem to be around 5,000 biblical manuscripts (Schlager 2012, 21); the vast majority of which are undated. The MBH Project has so far identified 150 undated Bibles which were produced in Ashkenaz probably before 1300. Of the 2,367 fragments of undated manuscripts published on the BwB database, 94 fragments of biblical codices and 2 scrolls are estimated to be Ashkenazic; items dating from before 1300 (data available as of 12 March 2018). Of the dated manuscripts identified on the Sfardata codicological database, less than forty Ashkenazic Bibles are dated before 1300.

Manuscript mode or Production Unit mode

The MS Mode is a brief description of a manuscript as an entire object, generally found in catalogues. It is the main common approach of manuscripts.

The PU Mode (Production Unit Mode) is a codicological description model inspired by the publication of Patrick Andrieu, Paul Canar, and Marielena Mariani, *La Syntaxe Du Codex*, vol. 34, Bibliologia (Brepols Pub, 2013). This mode of description offers the possibility to describe the inner structure of the manuscripts, their material features as well as social and textual aspects.

Interoperability / Open Access

The MBH Database is a scientific database that will be soon interoperable with the *Biblisima Portal*.

General data will be openly accessible to users. Members will have to create an account in order to see the extensive data. (Coming soon)

Bibliography

The MBH webportal offers, in collaboration with Viktor Gollnitz (IFJS, Heidelberg), bibliographical references on Hebrew biblical manuscripts first entered on the *semla de website* see: "Bibliography on the Bible / Hebrew Biblical Manuscripts".

The references are imported into the MBH Database via the Drupal Bibliography Module. They can be downloaded in RIS or BibText format which is compatible with the Zotero Bibliographical system.

turgical scrolls, whether the sources are complete, incomplete or fragmentary, which is a methodological novum.

In order to achieve its aims, the MBH project gathers corpus-based research data either 1) based on the analysis of specific library collections that are both easily accessible in situ and online (for instance in London, Oxford, Cambridge, Parma, the Vatican City, and Paris), or 2) connected to specific noteworthy elements that could be the subject of a separate study (such as Hebrew manuscripts of remarkable formats: either the very small ‘Paris Bible’ or the very large ‘Giant Bible’). Like similar current projects conducted on manuscripts, for instance *E-Ktobe* on Syriac items, the MBH database intends to mention how its information has been collected (derived from printed catalogues or other sources), whether the information has been checked against the original or digitised images and, finally, whether it comes from codicological and palaeographical research carried out especially for the MBH project in the holding library (a budget is available for library visits). This transparency will allow other researchers to distinguish the least studied sources, the ones that are less easily accessible or the ones that require more analysis. Interoperability is a priority and establishing closer ties with a portal such as *Biblistima* should greatly facilitate this work.

Furthermore, in order to facilitate the dissemination of its research, the MBH project will develop a specially dedicated web portal and accommodate a certain number of data research tools useful for the investigation of the Bibles’ materiality and history. There are plans for the development of a plug-in extension, called Graphoskop, adapted to Hebrew script (in collaboration with Maria Gurrado, IRHT Paris). A relevant bibliography and links to existing digital library collections will be included (in collaboration with Viktor Golinetz, HFJS Heidelberg), but also other data or techniques that could enable future inter- or transdisciplinary investigation.

In addition, the EAJS Lab international workshop ‘Research Approaches in Hebrew Bible Manuscripts’, held in June 2016 in Aix-en-Provence and organised by Élodie Attia, Antony Perrot, and Samuel Blapp, stressed the benefits of cross-fertilising research approaches used to analyse sources from antiquity and those common in research carried out on medieval texts, even though these are separate fields of study. An interdisciplinary seminar in collaboration with Patrick Andrist (ERC ParaText Bib, Munich) and Marilena Maniaci (Università degli studi di Cassino e del Lazio meridionale) is planned for November 2018 at the Paul Albert Février Center TDMAM (UMR 7297) in Aix-en-Provence. A collaboration with Javier del Barco (CSIC Madrid) and his project LEGARAD is also scheduled for 2018 during his stay at the Institute for Advanced Studies (IMéRA Aix-Marseille). Last but not least, the

library of the Paul Albert Février Center TDMAM (UMR 7297) has been honoured by the donation of a new documentary collection unique in Europe: the private work library of Gérard E. Weil. This donation considerably enriches the Aix-Marseille University's holdings and the ANR MBH project has plans for a major symposium dedicated to this collection and the specialist's outstanding work on Hebrew biblical manuscripts.

For more information about the project visit the CNRS academic blog at <<http://mbh.hypotheses.org>>, and <<http://mbhproject.org>>.
